QUARTZITE ON KITCHEN COUNTER TOPS

Customer understands and agrees that the material selected is a Quartzite not a Granite. Quartzite is a metamorphic rock which contains a large percentage of silica (quartz) but also may contain many of the same minerals as marble, however unlike marble quartzites are formed under extreme heat and pressure which makes quartzites extremely hard like granite. Quartzites can be subject to etching and staining from a variety of sources, including but not limited to: acidic based water, foods and cleaning products, wine, coffee and olive oil. With proper sealing and cleaning most quartzite will hold up very similar to granite however each quartzite is different and should be tested for etching and scratching. If your quartzite is etched, stained or scratched it can be restored to its original beauty however this may require a professional stone restoration service.

The upgrade sealer "DRY TREAT STAIN PROOF Plus" must be applied to the surface to assist in maintenance and protection. STAIN PROOF Plus is included in any contract or pricing the customer may have received for quartzite used on kitchen counter tops. The STAIN PROOF Plus WARRANTY does not apply to this material.

When cleaning your Quartzite counter tops use only water and a small amount of dishsoap or use only non-alkaline cleaner such as "Dry Treat REJUVENATA" or "Method Daily Granite" available at many retail locations.
